### Compare Access Techniques

Clear, concise frames with visuals, descriptions, and quick actions. Color scheme is user-defined.

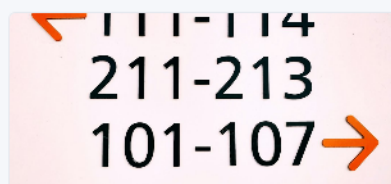

Target Audience

To be specified

Techniques to Compare

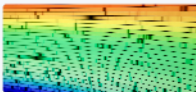

To be specified (e.g., TDMA, FDMA, CDMA, OFDMA)

Frame Title • TDMA Overview

111-114  
211-213  
101-107 →

Frame Title • FDMA Overview

A 2D spectral plot showing frequency on the vertical axis and time on the horizontal axis. The plot displays a grid of distinct, non-overlapping colored rectangles, representing individual frequency slots allocated to different users. The colors range from blue at the bottom to red at the top.

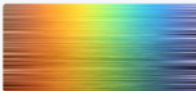

Brief Description

Each user gets a dedicated frequency band. Minimal interference between users, requires guard bands.

Key point: Steady quality but less flexible spectrum use.

See Example

Frame Title • CDMA Overview

A 2D spectral plot showing frequency on the vertical axis and time on the horizontal axis. The plot displays a solid, continuous band of color, representing a shared frequency band used by multiple users simultaneously. The colors range from blue at the bottom to red at the top.

Brief Description

Multiple users share the same band with unique codes. Robust to interference, needs precise synchronization.

 Learn More

#### Frame Title • OFDMA Overview

**Brief Description**  
Divides spectrum into many subcarriers assigned across users/time. Efficient and scalable for data-heavy use.

 Key point: High throughput with flexible scheduling.
